

Document 1: Brainstorming & Idea Prioritization

1. Overview & Objectives

This document captures the raw ideas generated during the product discovery phase and applies a structured framework to prioritize them. The goal is to separate high-value, feasible concepts from low-impact ones.

2. Brainstorming Session Notes

Idea A: [Insert brief description, e.g., Add an AI-powered onboarding chatbot]

Idea B: [Insert brief description, e.g., Create a one-click data export to Excel]

Idea C: [Insert brief description, e.g., Redesign the checkout page for mobile users]

Idea D: [Insert brief description, e.g., Build a dark mode toggle for the dashboard]

3. Prioritization Framework: Impact vs. Effort Matrix

To determine which ideas to pursue immediately, concepts are mapped based on their expected user value (Impact) and implementation complexity (Effort).

Quick Wins (High Impact, Low Effort)

Idea C (Mobile Checkout Redesign): Addresses a known drop-off point with minimal backend changes.

Major Projects (High Impact, High Effort)

Idea A (AI Chatbot): High potential for user engagement but requires extensive development and training.

Fill-Ins (Low Impact, Low Effort)

Idea D (Dark Mode): Nice-to-have feature that satisfies user requests but does not directly drive core business metrics.

Thankless Tasks (Low Impact, High Effort)

Idea B (Excel Export Expansion): High technical debt to update legacy export systems for a small subset of power users.

4. Next Steps & Action Items

1. **Advance Quick Wins** directly into the scoping and wireframing phase.
2. **Scope Major Projects** to break them down into smaller, iterative phases.
3. **Backlog Fill-Ins** to be completed during low-intensity development sprints.
