

Comic Craft: Data Flow Diagram

The Ink & Pipeline: Structural Information Flow

This document charts the operational flow of system parameters as data sets move from entry views to deep persistence stores.

Stage 1: The Sketchbook (User Input Layer)

- **Description:** Raw keystrokes, form telemetry, and uploaded assets originate at the client application interface.
- **Target:** Dispatched over HTTPS secure connections directly to operational API endpoints.

Stage 2: The Inking Process (Validation & Logic Gate)

- **Description:** Ingestion middleware cleanses, sanitizes, and evaluates incoming structures against strict domain authorization models.
- **Target:** Rejected payloads trigger error exceptions; certified data drops forward onto the processing stream.

Stage 3: The Comic Archives (Database Layer)

- **Description:** Validated entities write permanently to transactional relational structures and distributed cache systems.
- **Target:** ACID-compliant row storage, tracking structural relationships and system mutations.

Stage 4: The Comic Stand (Output Generation)

- **Description:** Aggregation nodes read persistent database models, build dynamic presentations, and return finalized JSON metrics to user view panels.
